This folder contains all the PDF materials for lab leaders. Do not share this with anyone.

Do not download the PDF document. Simply access the document via the URL because I usually update the documents from time to time. You want to be able to see the up-to-date version of the document.

Do not share the instructor material with the students.

The labs are 50 minutes long. Realistically, it is 45 minutes long after setting up. You must manage your time effectively.

Lab problems are made available to students at 12:00 AM every Tuesday and are due 11:59 of the following Monday. Students can access the materials from Webcourses and look for "Practice Problem X". All the instructions are available there.

You are free to determine how to run your lab session. I recommend making it interactive. You may want to have students work on this problem first before giving the answers. If you do live coding, you can use the comments I left in the source code as your narration.

During the lab session, you may want to invite your students to help their classmates. This will enable you to proceed with the discussion when you are in a time crunch.

Make sure that you are able to show students the solution within the lab session.

You must use the answers I provided when discussing the solution to the problem. Do not deviate because I want to ensure consistency among all sections. If you believe that there is a bug, let me know right away!

Unless I explicitly instruct, you must answer the Guide Questions and discuss them with the students during the lab. To save time, make sure to integrate this with your live coding, if possible.

Feel free to share any personal tips to help students solve the problem or any similar problem in the future.

Remind your students that you are their main point of contact if they have any questions about the practice problems. I will redirect students to you if they contact me about lab problems.

Remind students to submit their work on CodeGrade to receive credit. They should aim for a perfect score. Remind them of the deadline.

Occasionally, I will add some secret test cases in CodeGrade. If the student's solution is the same as the sample solution, the student's submission should pass the secret test cases. I am

unable to disclose the secret cases. One thing to note is that the secret case follows the specifications in the document.

The solution becomes available to the students after the deadline. They just have to use the same link.

Count the number of students who attended your lab and record it in the spreadsheet. This is how I will keep track of your working hours for Workday.
