Audience Profile

The audience that my *Professional Information Project* is designed for are my peers within the School of Computer Science at UCF. Specifically those who have prior experience utilizing code editors like *VS Code* or *CLion* to complete their school assignments. This group originates from a technical background and is comfortable interacting with their computer through advanced methods.

The primary goal of my document is to serve as an introduction to the code editor *Vim*, which is a niche tool designed to edit source code in a manner that minimizes the usage of the mouse. This tool requires a dense set of knowledge for even novice usage, which serves as a barrier to adoption for the general programming population. Thus it is my goal to author a professional document in order to assist my fellow programmers in learning to use the program, which should enhance their efficiency and grow the local community surrounding a personal interest.

As the audience has a basic proficiency within code editors they will understand the fundamental concepts utilized within my document. Additionally they will know how to perform tasks such as: installing a program onto their computer, modifying or upgrading a previous program, and basic troubleshooting on their local device. These are all skills required to properly utilize the contents of the document and gain an understanding of the program *Vim*.

Although the audience will possess common technical knowledge and skills, the program will be completely unfamiliar to them as it's methodology and philosophy is distinctive. Additionally the program by nature is operated primarily through the use of the keyboard and requires users to have an extensive set of typing skills. These skills will only be

developed within a subset of those who consume the document, while those without them will experience additional difficulty following.

The content presented within will be presented as a means in which to increase one's efficiency in writing code. The overarching promise of performance enhancement will serve as the main draw behind the document and the practice required to properly utilize the advice provided. While the surface level use of *Vim* can be challenging to learn in a single sitting, overall the amount of knowledge required to use it is manageable. This amateur use of the application is the goal of the document, but the tool itself contains leagues of depth and complex behavior. Much like other examples of professional software, for instance *Photoshop* or *Blender*, it would take thousands of hours of investment to master *Vim* in its entirety. Such an environment is bound to draw inquiry from an audience that is engaged with the content, as each presentation of introductory features can easily lead to a multitude of supplementary questions.

Ideally upon the completion of the document and an their initial trial of the program my audience would show a continued interest in using the program and have a desire to continue practicing. The majority of people have either never been exposed to text editing in this manner or have never attempted to use *Vim* due to a perception of overcomplexity. My goal with this project is to provide a proper introduction to a subject that has genuinely changed the manner in which I interact with computers.

As a result of my collective analysis, my *Professional Information Project* will be catered to an audience that while lacking domain experience still has a overall expertise in technology. It will be designed to promote the idea that learning to use the program *Vim* will greatly improve their ability to write and edit code. In order to achieve this, the format and tone of the project will be designed to provide a guide that is as approachable as possible.
